

Conclusion of the BESA Test SD 1

Humans represent a kind of receiving antenna for environmental information. This is because human life is fundamentally and exclusively dependent on environmental information. Our organism is biologically very sensitive where there is natural information (fields) or where this natural information is subject to interactions and fluctuations.

The situation is all the more dangerous when such fields of building structures are introduced (injected) into the body as nanoparticles via a so-called mRNA vaccine. For this reason, ascertained informative electromagnetic interference fields are biologically highly relevant. Any reduction or conversion of these interference fields (ideally 100 percent) is biologically very important, in the case of these tested vaccines it may even be vital.

These information loads from the vaccine as well as from our artificial environment are only compatible with life if they can be adapted to a natural fluctuation tolerance again. Disturbances, problems, blockages, disharmonies in the human biological control loop are caused by such disruptive electromagnetic information influences. Neutralizing or harmonizing effects could be proven in this project P50 2.1 to determine the effect of the test object, the "Human Protect SD1". The "Human Protect SD1" was able to neutralize the biologically disadvantageous effects and effects of the stress factors tested on the test subjects.

Due to the ingredients in the corona mRNA and vector-based vaccines, a completely new situation and challenge for the human immune system has been created. It will occupy the dominant science for decades to find solutions to the resulting questions. Many solutions and answers already exist. They provide an important approach to understanding what is happening on the human level. But the greatest challenge lies ahead of those people who already have previous health problems and are taking medication. Because nobody can imagine what effects these drugs produce in connection with mRNA or vector-based vaccines. Many question marks have already arisen within this detailed project. Further projects will be needed to solve this.

But the decisive factor for this detailed project is the decisive ability of the test object, the "Human Protect SD1", to neutralize and harmonize the stress factors tested in this project P50 2.1. The conversion of the tested information into bioenergy information with biological and life-promoting quality is proven with this project.
